Sunita Pathak M.B.A., M.S.W.

#### Interstitial lung disease (ILD): The challenge in diagnosing ILDs in India

Interstitial lung diseases (ILDs) are a heterogeneous group of acute and chronic bilateral lung diseases of known and unknown causes and pose diagnostic and therapeutic challenges to the clinician. Clinicians and patients confronted with ILD are understandably frustrated as there is no cause or cure for most of ILDs. The challenge in diagnosing ILDs in India is confounded by environmental and cultural factors in the midst of infections, especially tuberculosis. The lack of resources and standardized health care in India, lack of standardized approach to diagnosis of ILD, and the apparent phobia, reluctance, hesitancy, and/or uncertainty that most patients in India when confronted with the need for surgical lung biopsy (SLB) express contribute to the current conservative approach to the diagnosis of new onset of ILD in India, i.e., assumed diagnosis and reliance on the individual clinician's judgment. Thus, the treatment

of ILDs is empirical in most patients. Interstitial lung disease describes a large group of disorders, most of which cause progressive scarring of lung tissue. The scarring associated with interstitial lung disease eventually affects your ability to breathe and get enough oxygen into your bloodstream...Interstitial lung disease can be caused by long-term exposure to hazardous materials, such as asbestos, some types of autoimmune diseases, such as rheumatoid arthritis, also can cause interstitial lung disease. In most cases, however, the causes remain unknown. The lung scarring that occurs in interstitial lung disease can't be reversed, and treatment will not always be effective in stopping the ultimate progression of the disease. Some treatments may improve symptoms temporarily or slow the disease's progress. Others help improve quality of life. Because many of the different types of scarring disorders have no approved or proven therapies, clinical studies may be an option to receive an experimental treatment.

**K**ETIMES

### **Human Lungs Anatomy - Basic Concept**

The trachea, also called the windpipe, is part of the passageway that supplies air to the lungs. Any prolonged blockage, even for a few minutes, can cause death. The trachea is about 4.5 inches long and 1 inch in diameter, and is comprised of smooth muscle and several c-shaped rings of cartilage. The rings of cartilage provide stability and help to prevent the trachea from collapsing and blocking off the airways. The trachea extends from the neck and divides into two main bronchi. Structurally similar to the trachea, the two primary bronchi are located inside the lungs. The right bronchus is slightly larger than the left one. Because of this, foreign objects breathed into the lungs often end up in the right bronchus. The bronchi are lined with the same type of mucis that lines the rest of the respiratory tract. Deeper into the lungs, each bronchus is further divided into five smaller, secondary bronchi, which provide air to the lobes of the lungs. There are three

lobes at right side (upper, middle & lower) whereas two lobes at left side (upper & lower). These lungs lobes are further divided into segments. Right lungs have 10 segments whereas left lung has 8 segments. The secondary bronchi continue to branch off to form the tertiary bronchi, which are further divided into terminal bronchioles. There are as many as 30,000 tiny bronchioles in each lung. They lead to the alveoli by way of alveolar ducts. Together, the trachea and the two primary bronchi are referred to as the bronchial tree. At the end of the bronchial tree lie the alveolar ducts, the alveolar sacs, and the alveoli. The tubes that make up the bronchial tree perform the same function as the trachea; they distribute air to the lunes. The alveoli are responsible for the primary function of the lungs, which is exchanging carbon dioxide and oxygen. A layer of protective mucus, called a mucus blanket, covers a large portion of the membrane lining the bronchial tree. The mucus is an important air purifier.

#### Tension Pneumothorax — a Medical Emergency

Tension pneumothorax is a life-threatening medical emergency condition that can occur with chest traus and is more likely to happen with trauma involving an opening in the chest wall & sometimes due to rupture lungs bulla in case of emphysema / COPD. Recognizing and treating it quickly is important. Tension pneumothorax is the progressive build-up of air within the pleural space, usually due to a lung laceration which allows air to escape into the pleural space but not to return. Positive pressure ventilation may exacerbate this 'one-way-valve' effect. Progressive build-up of pressure in the pleural space pushes the mediastinum to the opposite hemithorax, and obstructs venous return to the heart. This leads to circulatory instability and may result in traumatic arrest. The classic signs of a tension pneumothorax are deviation of the trackes away from the side with the tension, a hyper-expanded chest, an increased percussion note and hyper-expanded chest that moves little with respiration. The central venous pressure is usually raised, but will be normal or low in hypovolaemic states. However these classic signs are usually absent and more commonly the patient is tachycardic and tachypnoeic, and may be hypoxic. These signs are followed by

circulatory collapse with hypotension and subsequent traumatic arrest with pulseless electrical activity (PEA). Breath sounds and percussion not may be very difficult to appreciate and misleading in the trauma room. Tension pneumothorax may develop insidiously, especially in patients with positive pressure ventilation. This may happen immediately or some hours down the line. An unexplained tachycardia, hypotension and rise in airway pressure are strongly suggestive of a developing tension. Treatment include immediate oxygen support & urgent water sealed ICD (intercostal drainage)

From the desk of Breathe Easy Interndoctor - Dr. Swapnil Pathak (MBBS)

#### Allergy Rhinitis Patient Name: Shri Rohit Kumar

Age: 35 year

Symptoms: Sneezing, Itching, Runny Nose Since last 5 Year

Previous Treatment: Oral Steroids, Cough Syrup

Test: Allergy Test has been performed & finally the patient is

being diagnosed with Allergic Rhinitis.

Current Treatment: Nasal Spray with oral Antihistamines along with Immunotherapy (Vaccine).

Now patient is felling very well & use to do his work hassle

From the desk of Breathe Easy Resident Doctor

#### Obstructive Sleep Apnea

Patient Name: Shri Tribhuvan Srivastava

Symptoms: Excessive daytime sleepiness, loud snoring, High

od pressure, morning headache since last 8 years

Previous Treatment: lisinopril, losartan etc.

Test: Sleep Test & finally the patient is being diagnosed with

Current Treatment: Recommendation to change the lifestyles, edical treatment and CPAP.

Result: Now patient enjoys his work without any problem & use to take his full sleep without disturbing anyone

बेस्ट पत्तउण्डेभन 🗉 हामेनिटी,

# ब्रेथ ईजी ने किया अपनी क्वालिटी कंट्रोल मापदंडों को और भी ज्यादा सुदृढ़

ब्रेथ ईजी सेंटर पूर्वांचल का एक अग्रणी चेस्ट केयर अस्पताल बन गया है जहाँ पर मरीजो को कम समय में एवं कम खर्च में जाँच की एवं इलाजीय स्विधाय मिल जाती है। ब्रेथ ईजी समय-समय पर स्वास्थ्य जागरूकता रैली, कैंप करके लोगों को श्वास रोगों के प्रति सजग कराता रहता है, जो एक स्वस्थ समाज के लिए जरूरी है। ब्रेय ईज़ी ने अपनी क्वालिटी कंट्रोल मैनेजमेंट के मापदंडों को और भी ज्यादा सृदिङ किया हैं, जिसके लिए ब्रेथ ईज़ी को ISO 9001: 2015 का सर्टिफिकेशन प्राप्त हुआ हैं जोकि पूर्वांचल के चुलिन्दा अस्पतालों के पास हैं।

from the desk of Breathe Easy Marketing Executive

पी.एम् अथवा पटिकुलेट मेटर to माइक्रोन से ज्यादा बडे होते हैं तो वो हमारे फेफड़ों के निचले हिस्से तक नहीं पहच पाते क्योंकि वो हमारे नाकों के फिल्टर की वजह से उपर ही रह जाते हैं परन्तु पी.एम् २.५ हमारे फेफड़ों के निचले हिस्से तक जाते हैं, और ये वहां जाकर स्जन पैदा करते हैं, जहाँ गैस एक्सथेज होती हैं, इसलिए ये ज्यादा महत्वपूर्ण होते हैं l हर चीजों के PM २.५ अलग-अलग असर करते हैं, जैसे डीजल के / निर्माण कार्य के / पेट्रोल के / पटाखों के PM २.५ अलग-अलग नुक्सान करते हैं । पटाखों में चारकोल व हैवी मेटल होता हैं. वो न सिर्फ केवल फेफड़ों को, अपित् दिल, दिमाग व पेट आदि को भी नुक्सान पहचाते हैं । पटाखाँ से निकलने वाले PM २.५ कुछ ज्यादा ही हानिकारक होते हैं I दीवाली पर जलने वाले पटाखाँ को लेकर चेस्ट रिसर्घ फाउंडेशन (सीआरएफ) और पूर्ण यूनिवर्सिटी ने दो साल पहले कुछ तथ्य सामने रखे थे, रिसर्च में सामने आया है कि, काले रंग की गोली जैसी टिकिया थानी सांप पटाखा (स्नेक टैबलेट) सबसे ज्यादा प्रदूषण फैलाती है, एक स्लेक टेबलेट सिर्फ १२ सेकंड में जल जाती है, इसका प्रभाव तीन मिनट तक रहता है. इतनी देर में यह पीएम २.५ के ६४,५०० एमशीजी/एम३ पैदा करता है, यह किसी भी पटाखे से निकले वाले प्रदूषण में सबसे ज्यादा है। नॉर्मल लेवल पर पीएम २.५ की स्वीकार्य सीमा सिर्फ ५० एमसीजी/एम३ है, एक हजार पटाखों वाली लड़ी ४८ सेकेंड में ३८,५४० एमसीजी/एम३ पैदा करती है, जोकि बहुत ही ज्यादा खतरनाक होती हैं।

From the desk of Breathe Easy Sub Editor

### ब्रेथ ईजी हुआ उत्तर प्रदेश का पहला वायु प्रदूषण मुक्त अस्पताल

ब्रेथ ईज़ी टी.बी चेस्ट एलर्जी केयर अस्पताल (अस्सी, वाराणसी) उत्तर प्रदेश का पहला प्रदुषण मुक्त अस्पताल हो गया हैं, जहाँ मरीजों के लिए बड़े-बड़े ऑक्सीजन चैम्बर के साथ हवा को फिल्टर करने वाले मशीन लगे हैं, मरीज जैसे ही ब्रेथ ईज़ी अस्पताल में आयेगा उसे १००% शुद्ध हवा मिलेगी, मरीज को ऐसा प्रतीत होगा, मानो वो प्रात: काल में किसी हरे-भरे पार्क में बैठा हो । इसको संभव बनाया हैं ब्रेथ ईज़ी अस्पताल के निदेशक डॉ एस.के पाठक के अथक प्रयासों ने जहाँ साँस के मरीज ले सकते हैं हर सांस आराम से ।

#### सी.ओ.पी.डी. के कारक

सी.ओ.पी.डी जैसी गंभीर फेफड़े की बीमारी से खुद को बचाना है, तो सिर्फ धूमपान छोड़ना ही काफी नहीं है, बिल्क खाने में साबुत अनाज, पॉलीअनसेचुरेटेड वसा और बादाम जैसे सूखों मेवा को अवश्य शामिल करें । सीओपीडी होने की सबसे बड़ी वजह धूमपान मानी जाती है, हालांकि सीओपीडी के एक तिहाई मरीजों ने कशी धूमपान नहीं किया, जिसका मतलब है कि इसके लिए कुछ और वजह भी जिम्मेदार हैं । एक शोध में आहार की गुणवत्ता यानी अल्टरनेटिव हेल्दी इटिंग इंडेक्स २०१० (एएचईआई-२०१०) और सीओपीडी की जांच में यह सामने आया है कि कम गुणाँ वाले आहार लेने वालों के मुकाबले में स्वस्थ आहार लेने वालों में सीओपीडी का खतरा एक तिहाई कम होता हैं।

# धुम्रपान से नाता तोड़ें - अपनी जिन्दगी से नाता जोड़ें

एक अध्ययन कहता है कि धूमपान बिल्कुल छोड़ने के 12 घंटे के भीतर खून या रक्त प्रवाह में Co (कार्बन मोनोऑक्साइड) का स्तर सामान्य आ जाता है, फेफड़ों की स्थिति में सुधार हो जाता है। एक वर्ष के भीतर ही इदय रोग की बढ़ी सम्भावना कम होने लगती है और शरीर व मन का स्वास्थ्य बढ़ने लगता है। धुमपान से नाता तोड़े, अपनी जिन्दगी से नाता जोड़े।
